PRODUCTS & COMPATIBILITY

Custom PC Builds

PixelForge offers gaming computers designed for different performance requirements, budgets, and gaming preferences. Customers may purchase standard prebuilt systems or request configuration changes when supported by the available product options.

A custom gaming PC allows customers to prioritize components such as the processor, graphics card, memory, storage, and cooling system according to their intended use.

Choosing a Configuration

When selecting a gaming PC, customers should consider the games and applications they intend to use, their monitor resolution, desired performance, and available budget.

For gaming at 1080p resolution, a balanced mid-range configuration may provide suitable performance for many modern games. Higher resolutions, demanding graphical settings, and high-refresh-rate gaming may benefit from more powerful graphics hardware.

Customers who also perform video editing, software development, streaming, or 3D rendering may require additional processor performance, memory capacity, or storage space.

PixelForge recommends selecting components based on realistic performance requirements rather than purchasing the most expensive available hardware without considering the complete system.

Available Customization Options

Depending on the computer model, customers may be able to choose between different processors, graphics cards, memory configurations, storage capacities, and cooling solutions.

Not every component combination is available. Certain upgrades may require a different motherboard, power supply, or computer case.

PixelForge reviews supported configurations to reduce the risk of incompatible hardware combinations. However, customers requesting changes outside the available configuration options should contact support before placing an order.

Assembly and Cable Management

Gaming PCs assembled by PixelForge are built using components selected for the approved configuration.

During assembly, technicians install the processor, memory, storage devices, graphics card, cooling equipment, and other necessary hardware.

Internal cables are arranged to support airflow and reduce interference with moving components such as cooling fans.

Technicians also verify that major power connectors are properly installed and that components are securely mounted.

Quality Control and Testing

Before dispatch, assembled gaming PCs undergo a quality control procedure. This may include checking that the computer starts correctly, verifying installed hardware, inspecting cooling operation, and performing basic system stability tests.

Where an operating system is included, technicians may verify that the system can complete initial startup and recognize the installed hardware.

Testing is intended to identify obvious assembly or component problems before shipping. It does not guarantee that every possible software configuration or third-party application will operate without issues.

Operating Systems and Software

Some PixelForge gaming PCs include a preinstalled operating system, while others may be sold without one. The product description identifies what is included.

Customers purchasing a computer without an operating system are responsible for installing suitable software and obtaining any required licenses.

Optional software, additional applications, and third-party subscriptions are not included unless explicitly stated in the product description.

Assembly and Delivery Times

Standard prebuilt gaming PCs normally have an estimated total delivery time of 5–8 business days after payment confirmation. This includes preparation, testing, dispatch, and transportation.

Custom configurations may require additional assembly time, particularly when selected components are not immediately available.

If a configuration requires special ordering or additional preparation, PixelForge will communicate an estimated timeframe when possible.

Customers receive a shipping confirmation and tracking information once the computer has been dispatched.

For general delivery estimates, see Delivery Times.

Upgrading a PixelForge Gaming PC

Customers may upgrade compatible components after purchasing a gaming PC. Common upgrades include adding memory, installing additional storage, or replacing the graphics card.

Before upgrading, customers should verify motherboard compatibility, power supply capacity, physical clearance, and cooling requirements.

Incorrect installation or incompatible components may cause system instability or hardware damage.

Customers should disconnect the computer from electrical power before performing internal hardware changes and follow appropriate safety precautions.

Warranty and Customer Modifications

Standard prebuilt gaming PCs assembled by PixelForge include a voluntary two-year hardware warranty unless otherwise stated at purchase.

The warranty generally covers manufacturing and assembly defects under normal operating conditions. Damage caused by incorrect installation, unsuitable modifications, or misuse may fall outside the voluntary warranty.

Opening the computer case or installing an upgrade does not automatically remove statutory consumer rights. The cause of any reported defect must be assessed in relation to the circumstances.

For complete warranty conditions, see Warranty Policy.

Returns and Special Configurations

Standard prebuilt gaming PCs are generally covered by ordinary consumer withdrawal rights for online purchases.

Certain clearly personalized or specially manufactured configurations may be subject to legal exceptions when the applicable requirements are satisfied.

Customers should not assume that every assembled computer is automatically excluded from withdrawal rights. The applicable rules depend on the nature of the specific purchase.

For more information, see Return Policy.

Getting Help With a Build

Customers seeking configuration advice should describe their intended applications, monitor resolution, budget, and any existing hardware they plan to reuse.

Providing this information helps PixelForge identify suitable component combinations and explain potential limitations.

For individual component requirements, consult PC Components Compatibility.
