PAYMENTS

# Payment Security

PixelForge aims to provide a secure shopping environment for customers purchasing gaming hardware and accessories. Payment security involves protecting sensitive information, verifying transactions, preventing unauthorized purchases, and helping customers recognize potential fraud.

PixelForge works with external payment service providers to process transactions using established security technologies and appropriate authentication procedures.

## Secure Connections

The PixelForge website uses HTTPS connections to protect information transmitted between customers' browsers and the website.

HTTPS uses encryption to reduce the risk of unauthorized parties reading or modifying information while it travels across a network.

Customers should verify that they are visiting the correct PixelForge website before entering account or payment information.

A secure connection is an important protection, but it does not guarantee that every website displaying a lock symbol is trustworthy. Customers should also check the website address carefully.

## Payment Service Providers

Card payments and other financial transactions are processed through external payment providers.

PixelForge does not normally store complete card numbers, card security codes, or online banking credentials in its own application database.

Payment providers are responsible for implementing the security controls applicable to their services, including relevant payment industry requirements.

PixelForge receives the transaction information necessary to administer purchases, confirm payments, and process refunds.

## Strong Customer Authentication

Certain online payments require strong customer authentication under applicable European payment regulations.

Customers may be asked to confirm a payment through their banking application, a one-time verification procedure, or another authentication method supported by their payment provider.

These additional steps help reduce the risk of unauthorized transactions.

Customers should never approve an authentication request that they did not initiate or do not recognize.

## Protecting Your Account

Customers should use strong, unique passwords for their PixelForge accounts and avoid reusing passwords from other services.

Passwords should not be shared with other people or sent through email or ordinary support messages.

Customers who suspect unauthorized account access should change their password immediately and contact PixelForge support if suspicious orders or account changes are discovered.

For more information about login security and account recovery, see Customer Accounts.

## Recognizing Fraudulent Messages

Fraudulent emails, text messages, and websites may attempt to impersonate online retailers or delivery companies.

Common warning signs include urgent demands for payment, unexpected requests for account credentials, suspicious links, unusual sender addresses, and messages claiming that a delivery cannot proceed without an additional payment.

Customers should avoid opening suspicious links and should navigate directly to the official PixelForge website when checking an order.

PixelForge will never ask customers to disclose their account password or complete payment card security code through an ordinary support email.

## Unexpected Payment Requests

Customers may occasionally receive legitimate payment notifications from an invoice provider or shipping service. However, unexpected requests should always be verified before payment is completed.

PixelForge does not add shipping charges to confirmed orders without the customer's approval.

If a message claims that additional shipping fees must be paid, customers should verify the request through the original order information or contact support.

For details about standard shipping charges, see Shipping Information.

## Suspicious or Unauthorized Transactions

Customers who notice an unfamiliar transaction should contact their bank or payment provider promptly.

The payment provider can explain available procedures for reporting unauthorized card transactions, disputing charges, or protecting the affected payment method.

Customers should also contact PixelForge support if the transaction appears connected to a PixelForge order.

Support may investigate the associated purchase, but PixelForge cannot independently reverse every transaction or make decisions that belong to the payment provider.

## Duplicate Charges

A customer may occasionally see multiple payment entries after an interrupted checkout or repeated payment attempt.

Some entries may represent temporary card authorizations rather than completed charges.

Customers should check whether the transactions are pending or finalized before attempting another purchase.

If two completed charges appear to relate to the same order, customers should contact support with the order number and relevant transaction details.

Customers should not send complete card numbers or security codes when requesting assistance.

## Refund Security

Refunds are normally returned through the original payment method to reduce the risk of fraudulent redirection.

If a customer is asked to provide new banking information for a refund, they should verify the request through an established PixelForge support channel before sharing any details.

PixelForge may require additional identity verification when an alternative refund method is necessary.

For information about refund processing times, see Refund Process.

## Protecting Personal Information

Payment security also involves protecting customer names, addresses, transaction references, and other personal information.

PixelForge limits access to payment-related information according to operational needs and applicable data protection requirements.

Personal information is retained only for appropriate purposes and legal obligations, including relevant accounting requirements.

For information about personal data processing, see Personal Data & GDPR.

## Reporting a Security Concern

Customers who discover suspicious account activity, fraudulent messages, or potential payment security problems should contact PixelForge support.

When reporting an issue, customers should describe what happened and provide relevant order references without sharing passwords or complete payment credentials.

PixelForge may investigate reported security concerns and coordinate with payment providers or other relevant parties when necessary.
